In version 3.1* this card can only load Tails in low resolution (640 × 480).

In version 4.0 rc1, users reported that Tails freezes after the Boot Loader Menu screen.

Reported cards: Nvidia Geforce 2070 super, Nvidia Geforce 2070m RTX

The last message displayed on the screen, with debug nosplash boot options, is: `fb0: switching to nouveaufb from EFI VGA.`

I see lots of folks on the web with similar problems. Some have workaround'ed it with nomodeset.

#3 - 01/02/2020 03:31 PM - numbat

Boot option "nomodeset" works with "Nvidia RTX 2070 Super!"

#4 - 03/14/2020 03:33 PM - numbat

A user has done further testing with an Nvidia RTX 2070 Super:

1. `nomodeset` boot option gives the same error message (GDM error)
2. Debian Live works perfectly

Hi numbat,

numbat wrote (2020-01-02):

Boot option "nomodeset" works with "Nvidia RTX 2070 Super"!

Could you please ask this person to retry with Tails 4.4?

This appears to contradict the report from January. I guess that's because something changed in Tails, that caused this regression. In the future, it would be really helpful if you told us which version of Tails you're reporting about: without this info, it's hard to look for changes that may cause the problem.

Debian Live works perfectly

Do you know which version of Debian Live?
